The Late Market — a judge's guide

Siki & Zana · Zoud GameLab, “Make FinLit Fun” · ~10–15 minutes · free in your browser

> **What this is:** a financial-literacy game. You keep a stall open for one week, and a night market buys every invoice you leave. Defer once and a stall lights. The ending is what the street took.

How to play it so the street moves

- **Defer Harborne on Day 1.** £2,400 is already on the street. A stall lights in that same beat, and the stallholder speaks. Chase it instead if you want the money in the till tomorrow morning — Day 3 is the same offer, and that chase lands after the week closes.
- **Leave Quayline's bill** on Day 2. The till moves, and another stall lights. Paying it keeps the week open, and only yesterday's chase makes it affordable.
- **Name a floor** at the Claims Desk, three times. The picture at the end is your floor against their three opening numbers.

What the ending shows

- One large number: what the street took. Then two prices for the same wait — the street's, and the lawful one (UK statutory interest, or the Souq's contractual fee).
- The bias is named only if your two Harborne choices differed. A week that chased both is told so, in one sentence.
- **Two markets.** London uses pounds and the Late Payment of Commercial Debts Act. The Souq uses dirhams, a contractual late fee, and zakat on what you never collected. Same week. Pick either on the first screen.

Honest limits (stated in-game too)

- One week is one week. The debrief names a tilt only from the two choices you actually made.
- Fictional offers are labelled fictional; indicative ranges are labelled indicative. No provider is named or recommended; the game never moves money.
- Audio is optional; every line is subtitled. Simple-language mode, adjustable text size, and reduced-motion are in Options.

Artifacts: playable build (itch, private link in submission) · concept doc · budget doc · audit appendix (`docs/game/AUDIT.md`) · trailer (~105 s, both markets). Contact: Udi Robert (@udirobert).
